OPERATING SYSTEMS EXERCISE 1

Assignment A – mydiff

Implement a variation of the Unix-command diff. Write a C-program mydiff, which reads in two files und compares them. If two lines differ, then the line number and the number of differing characters is printed.

```
SYNOPSIS:

mydiff [-i] [-o outfile] file1 file2
```

The program shall read each file line by line und compare the characters. If two lines have different length, then the comparison shall stop upon reaching the end of the shorter line. Therefore, the lines abc\n und abcdef\n shall be treated as being identical.

Your program must accept lines of any length.

If the option -o is given, the output is written to the specified file (outfile). Otherwise, the output is written to stdout.

If the option -i is given, the program shall not differentiate between lower and upper case letters, i.e. the comparison of the two lines shall be case insensitive.

Hint: Take a look at the functions strncmp(3) and strncasecmp(3) for comparing two lines.

Testing

Test your program with various inputs, such as a file difftest1.txt with following content:

```
abc
operating
abcdefg
```

and a file difftest2.txt with following content:

```
abcdefg
Operating Systems
ahciejg
abcdefg
```

Executing your program should give an output similar to the following:

```
$ ./mydiff difftest1.txt difftest2.txt
Line: 2, characters: 1
Line: 3, characters: 3
$ ./mydiff -i difftest1.txt difftest2.txt
Line: 3, characters: 3
$ ./mydiff -o example.out difftest1.txt difftest2.txt
$ cat example.out
Line: 2, characters: 1
Line: 3, characters: 3
```

Coding Rules and Guidelines

Your score depends upon the compliance of your submission to the presented guidelines and rules. Violations result in deductions of points. Hence, before submitting your solution, go through the following list and check if your program complies.

Rules

Compliance with these rules is essential to get any points for your submission. A violation of any of the following rules results in 0 points for your submission.

1. All source files of your program(s) must compile via

```
\ gcc -std=c99 -pedantic -Wall -D.DEFAULT.SOURCE -D.BSD.SOURCE -D.SVID.SOURCE -D.POSIX_C.SOURCE=200809L -g -c filename.c
```

without *errors* and your program(s) must link without *errors*. The compilation flags must be used in the Makefile. The feature test macros must not be bypassed (i.e., by undefining these macros or adding some in the C source code).

2. The functionality of the program(s) must conform to the assignment. The program(s) shall operate according to the specification/assignment given the test cases in the respective assignment.

General Guidelines

Violation of following guidelines leads to a deduction of points.

1. All source files of your program(s) must compile with

```
$ gcc -std=c99 -pedantic -Wall -D_DEFAULT_SOURCE -D_BSD_SOURCE -D_SVID_SOURCE -D_POSIX_C_SOURCE=200809L -g -c filename.c
```

without warnings and info messages and your program(s) must link without warnings.

- 2. There must be a Makefile implementing the targets: all to build the program(s) (i.e. generate executables) from the sources (this must be the first target in the Makefile); clean to delete all files that can be built from your sources with the Makefile.
- 3. The program shall operate according to the specification/assignment without major issues (e.g., segmentation fault, memory corruption).
- 4. Arguments have to be parsed according to UNIX conventions (we strongly encourage the use of getopt(3)). The program has to conform to the given synopsis/usage in the assignment. If the synopsis is violated (e.g., unspecified options or too many arguments), the program has to terminate with the usage message containing the program name and the correct calling syntax. Argument handling should also be implemented for programs without arguments.
- 5. Correct (=normal) termination, including a cleanup of resources.
- 6. Upon success the program has to terminate with exit code 0, in case of errors with an exit code greater than 0. We recommend to use the macros EXIT_SUCCESS and EXIT_FAILURE (defined in stdlib.h) to enable portability of the program.
- 7. If a function indicates an error with its return value, it *should* be checked in general. If the subsequent code depends on the successful execution of a function (e.g. resource allocation), then the return value *must* be checked.

- 8. Functions that do not take any parameters have to be declared with void in the signature, e.g., int get_random_int(void);.
- 9. Procedures (i.e., functions that do not return a value) have to be declared as void.
- 10. Error messages shall be written to stderr and should contain the program name argv[0].
- 11. It is forbidden to use the functions: gets, scanf, fscanf, atoi and atol to avoid crashes due to invalid inputs.

FORBIDDEN	USE INSTEAD
gets scanf fscanf atoi atol	fgets, sscanf fgets, sscanf strtol strtol

- 12. Documenation is mandatory. Format the documentation in Doxygen style (see Wiki and Doxygen's intro).
- 13. Write meaningful comments. For example, meaningful comments describe the algorithm, or why a particular solution has been chosen, if there seems to be an easier solution at a first glance. Avoid comments that just repeat the code itself (e.g., i = i + 1; /* i is incremented by one */).
- 14. The documentation of a module must include: name of the module, name and student id of the author (@author tag), purpose of the module (@brief, @details tags) and creation date of the module (@date tag).
 - Also the Makefile has to include a header, with author and program name at least.
- 15. Each function shall be documented either before the declaration or the implementation. It should include purpose (@brief, @details tags), description of parameters and return value (@param, @return tags) and description of global variables the function uses (@details tag).
 - You should also document static functions (see EXTRACT_STATIC in the file Doxyfile). Document visible/exported functions in the header file and local (static) functions in the C file. Document variables, constants and types (especially structs) too.
- 16. Documentation, names of variables and constants shall be in English.
- 17. Internal functions shall be marked with the static qualifier and are not allowed to be exported (e.g., in a header file). Only functions that are used by other modules shall be declared in the header file.
- 18. All exercises shall be solved with functions of the C standard library. If a required function is not available in the standard library, you can use other (external) functions too. Avoid reinventing the wheel (e.g., re-implementation of strcmp).
- 19. Name of constants shall be written in upper case, names of variables in lower case (maybe with fist letter capital).
- 20. Use meaningful variable and constant names (e.g., also semaphores and shared memories).
- 21. Avoid using global variables as far as possible.
- 22. All boundaries shall be defined as constants (macros). Avoid arbitrary boundaries. If boundaries are necessary, treat its crossing.
- 23. Avoid side effects with && and $| \cdot |$, e.g., write if (b != 0) c = a/b; instead of if (b != 0) & c = a/b.

- 24. Each switch block must contain a default case. If the case is not reachable, write assert(0) to this case (defensive programming).
- 25. Logical values shall be treated with logical operators, numerical values with arithmetic operators (e.g., test 2 strings for equality by strcmp (...) == 0 instead of !strcmp (...)).
- 26. Indent your source code consistently (there are tools for that purpose, e.g., indent).
- 27. Avoid tricky arithmetic statements. Programs are written once, but read more times. Your program is not better if it is shorter!
- 28. For all I/O operations (read/write from/to stdin, stdout, files, sockets, pipes, etc.) use either standard I/O functions (fdopen(3), fopen(3), fgets(3), etc.) or POSIX functions (open(2), read(2), write(2), etc.). Remember, standard I/O functions are buffered. Mixing standard I/O functions and POSIX functions to access a common file descriptor can lead to undefined behaviour and is therefore forbidden.
- 29. If asked in the assignment, you must implement signal handling (SIGINT, SIGTERM). You must only use *async-signal-safe* functions in your signal handlers.
- 30. Close files, free dynamically allocated memory, and remove resources after usage.
- 31. Don't waste resources due to inconvenient programming. Header files shall not include implementation parts (exception: macros).

Exercise 1 Guidelines

Violation of following guidelines leads to a deduction of points in exercise 1.

- 1. Correct use of named sempahores (sem_open(3), sem_close(3) sem_unlink(3)) and POSIX shared memory (shm_overview(7)) for inter-process communication of separated programs (e.g., server and client).
 - Use your matriculation number as prefix in the names of all resources.
- 2. "Busy waiting" is forbidden. (Busy waiting is the repeated check of a condition in a loop for synchronization purposes.)
- 3. Synchronization with sleep is forbidden.
